

Our Tools

They say that "imitation is the most sincere form of flattery". And while other consultants have copied our ideas, you'll still find three unique factors about our tools that you won't find anywhere else.

Firstly we ensure that your people are choosing the right EHS tool at the right time and this is critical for guaranteeing the safety of people, assets and the environment.

Secondly we help your people understand how the various EHS tools fit together in controlling risk and we assist them make good decisions about when to select the right tool.

Finally - and most importantly we know that there is only one Hazard and Risk Management (HARM) process that should run through every EHS tool your people use.

Regardless if it's simple *Hazard Spotting* for a lower risk and routine task; a *JSA* in a group situation for a higher risk or non-routine job; or a more sophisticated Qualitative or Quantitative Risk Assessment for still higher-risk situations. There is only one HARM process that runs through all these EHS tools.

We call the HARM process *Think 6, Look 6* and we help oilfield workers to understand the practical implementation of the HARM process in all situations.

Think 6, Look 6 is found in everything we do. We incorporate *Think 6, Look 6* into all our Hazard Spotting, JSA and Risk Assessment tools.

In the next column is a list of ways in which we can help establish or enhance the use of the HARM process in your business.
